

STUDENT PEER FEEDBACK REPORT

Project: HDFC Bank HR Analytics Dashboard

REVIEWER	DATE	PERIOD ANALYZED
Student Peer	May 2026	July 2019 – June 2020

1. Executive Summary & Major Structural Flaw

Overall, this project demonstrates a highly detailed, data-rich analysis of a turbulent market period (July 2019 to June 2020). It does a fantastic job of breaking down how a major stock like HDFC Bank reacted to massive macroeconomic events like the COVID-19 crash.

However, there is a **critical structural mismatch** between the data presented and the project's labeling that must be corrected before submission:

The Disconnect	The dashboard is titled "HDFC Bank HR Analytics Dashboard" and references an "HR Analytics Pipeline-Time Allocation Model" extracting data from an "HRIS pull".
The Reality	Exactly 0% of the actual data relates to Human Resources. There are no metrics on employee turnover, retention, hiring, or payroll. Instead, 100% of the dashboard displays Financial Market Analytics —specifically stock prices, trading volumes, daily stock returns, and equity delivery ratios.
Recommendation	It appears a template or pipeline architecture from a previous HR assignment was reused, but the text labels were never updated. You must change all references from "HR Analytics" to "Financial Market Analytics" or "Equity Research."

2. Key Project Strengths

Despite the naming error, the technical execution of the data pipeline and business intelligence layering is excellent:

- ✓ **Rigorous Data Hygiene:** Explicitly stating that the dataset contains 245 rows and 21 columns with exactly 0 missing values and 0 duplicates post-cleaning shows fantastic attention to data engineering and data prep.
- ✓ **Effective Architecture:** Dividing the dashboard into a Diagnostic Layer (understanding the timeline of pre-COVID vs. COVID onset) and a Prescriptive Layer (the quarterly scorecards) provides a strong, logical framework for analytical storytelling.

✓ **Contextualizing Volatility:** The Top Extreme Events table is a brilliant addition. Highlighting specific historical days—such as the September 2019 stock split (−49.67% mechanical price adjustment) and the March 2020 panic days—gives the reader instant context for the spikes in volatility.

3. Data & Presentation Critiques

Text Typos & Formatting Errors

The data extraction in the tables contains several rough text artifacts that degrade the professionalism of the dashboard:

- In the Quarterly Scorecard for 2020 Q2, the text reads "Avg 2943-Vol 123B" and "**Renan: 25.0% rebound**". "Renan" is clearly a typo for "Return," and the hyphenation needs cleaning.
- In the Extreme Events table, the March 25, 2020 entry lists "**Reel rally**" (likely meant to be "Relief rally") and has misplaced numbers in the return column.

Metric Inconsistency (AVG CLOSE)

Metric	As Listed	Expected Range	Issue
Avg Close	1.381	~767 – ~2,495	Decimal placement error — likely should be 1,381

4. Final Action Items for Improvement

- 1. Rebrand the Dashboard:** Update the main header, the series label, and the pipeline phase model to remove "HR" and "HRIS". Replace them with "Equity Market Data" and "NSE Data Pull."
- 2. Recalculate / Fix the Average Close:** Fix the 1.381 metric so it accurately reflects the thousands-place value of the stock during that financial year.
- 3. Add Financial Commentary to the Prescriptive Layer:** Since you have a prescriptive layer, add a brief note explaining why certain shifts happened. For instance, note that the delivery ratio dropped significantly to 38.82% in 2020 Q2 because the immense market volatility caused a massive influx of short-term day trading rather than long-term institutional delivery.

This review is intended solely as peer feedback to assist in polishing the final dashboard presentation.
